

ASSIGNMENT 3

COORDINATION & UTILITY

Introduction and objectives

This assignment was divided into two different tasks:

1. **N-Queen problem.**
2. **Festival, highest utility problem: + Extra: Global utility.**

Task 1 : N-Queen problem

The objective in this task is to place N queens on a NxN chessboard such that each queen cannot attack or be attacked from all other queens; each queen is an agent and they communicate one with each other to establish the permitted cells.

In our simulation, we start with queens from the top and the first starts, occupies the first available position and once is placed, then the second one repeats the process; if for the j-th queen there are no available cells to occupy, then it asks to the previous queen to reposition, and this backward communication continues until one queen is available to move into a new position. Then, starting from the next queen from the repositioned one, the process of positioning starts again.

This goes on until a feasible combination is found.

Here's the result of the simulation with N = 4 and the side the log with the evolution of the problem:

```

> N-QUEEN.gaml (1 experiment)
Interactive console Console
Queen1: WAIT! position (0, 1) is forbidden. Trying the next one: (1, 1).
Queen1: WAIT! position (1, 1) is forbidden. Trying the next one: (2, 1).
OH NO! Nowhere to go. I'm Queen2 ( jj_stuck = 2 ).
I need to ask Queen1 to reposition.
Queen1: WAIT! position (0, 1) is forbidden. Trying the next one: (1, 1).
Queen1: WAIT! position (1, 1) is forbidden. Trying the next one: (2, 1).
Queen1: WAIT! position (2, 1) is forbidden. Trying the next one: (3, 1).
Queen2: WAIT! position (0, 2) is forbidden. Trying the next one: (1, 2).
OH NO! Nowhere to go. I'm Queen3 ( jj_stuck = 3 ).
I need to ask Queen2 to reposition.
OH NO! Nowhere to go. I'm Queen2 ( jj_stuck = 2 ).
I need to ask Queen1 to reposition.
Queen1: Oops... I'm stuck too. Gonna ask Queen0 to reposition!
So... jj_stuck = 1
Queen0: WAIT! position (0, 0) is forbidden. Trying the next one: (1, 0).
Queen1: WAIT! position (0, 1) is forbidden. Trying the next one: (1, 1).
Queen1: WAIT! position (1, 1) is forbidden. Trying the next one: (2, 1).
Queen1: WAIT! position (2, 1) is forbidden. Trying the next one: (3, 1).
Queen3: WAIT! position (0, 3) is forbidden. Trying the next one: (1, 3).
Queen3: WAIT! position (1, 3) is forbidden. Trying the next one: (2, 3).
**** YEAH! We did it !! ****

```

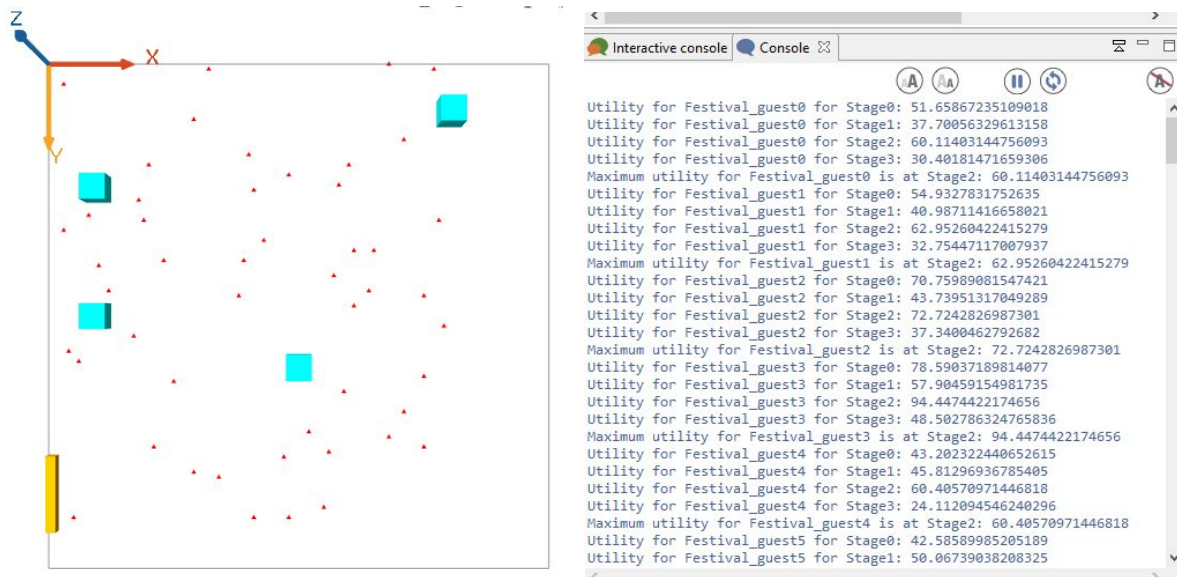

Here are the final positions of the queens with respectively $N = 8$ and $N = 12$:

Task 2 : Festival, highest utility problem

Creation of stages where agents can go to, they always know where they are placed. Depending on their own **utility**, the agent will decide which stage to go.

Here are the images for the task where each agent had to select a stage with maximum utility based on attributes like visuals, lights, sound, models, etc.

In this festival, each stage has a set of values for attributes like visuals, sounds, lights (randomized). Each agent first calculates the utilities for each stage depending upon its preferences for these attributes in a randomized manner and then selects the stage with maximum utility.

Extra Task : Festival, Global utility

As seen in the image, each agent interacts with the leader (white) to communicate its preferences for a stage based on its own personal utility. We have introduced "crowd mass", an additional attribute which creates a conflict of utilities for some agents. Agents who do not mind the crowd may be asked to move to another stage, different from their best choice for maximum global utility in order to accommodate the utilities of agents who do not prefer crowds. Hence, the leader may ask some agents to move around and compromise on their personal utility in order to improve the global utility.

```
Interactive console Console [X]
Festival_guest24 will move to Stage2based on the utility.
Festival_guest25 will move to Stage2based on the utility.
Festival_guest26 will move to Stage2based on the utility.
Festival_guest27 will move to Stage2based on the utility.
Festival_guest28 will move to Stage1based on the utility.
Festival_guest29 will move to Stage2based on the utility.
Festival_guest30 will move to Stage2based on the utility.
Festival_guest31 will move to Stage2based on the utility.
Festival_guest32 will move to Stage1based on the utility.
Festival_guest33 will move to Stage2based on the utility.
Festival_guest34 will move to Stage3based on the utility.
Festival_guest35 will move to Stage2based on the utility.
Festival_guest36 will move to Stage2based on the utility.
Festival_guest37 will move to Stage1based on the utility.
Festival_guest38 will move to Stage2based on the utility.
Festival_guest39 will move to Stage2based on the utility.
Festival_guest40 will move to Stage1based on the utility.
Festival_guest41 will move to Stage2based on the utility.
Festival_guest42 will move to Stage2based on the utility.
Festival_guest43 will move to Stage2based on the utility.
Festival_guest44 will move to Stage2based on the utility.
Festival_guest45 will move to Stage1based on the utility.
Festival_guest46 will move to Stage3based on the utility.
Festival_guest47 will move to Stage1based on the utility.
Festival_guest48 will move to Stage2based on the utility.
Festival_guest49 will move to Stage2based on the utility.
```

In the figure, we can see that the leader is coordinating between all the agents and instructing some agents to move to a different stage for the sake of global utility. This is done to make sure that agents who do not like the crowd can move to less crowded stages.
